

# H5 Matter Analytics: Enhancing review through email threading and advanced analytics

Accelerate review, evaluate the quality and composition of your productions, and know more faster with H5 Matter Analytics, the Relativity-integrated solution that assists you in creating efficiencies and managing workflow.

## Email Threading

H5's email threading is easy to setup, easy to run, and easy to interpret. Its Email Thread Viewer is integrated with Relativity to allow users quick and simple thread-by-thread review.

## Name Normalization

Link name variations and email addresses to a single individual from an automated name normalization process, and format names uniformly for email participants by configuring name order, capitalization, and even professional suffixes. Combine the power of name normalization with the H5 Thread Viewer to visually assist review.

## PII Identification

Quickly analyze data sets for categories of personally identifiable information (passport IDs, social security numbers, credit card numbers, and other PII) to assist in understanding sensitive data characteristics.

## Metadata Augmentation

Remediate data populations with missing or incomplete metadata, such as inbound productions or scanned documents, by auto-detecting and populating email metadata fields.

## Advanced Analytics

Analyze data for potentially privileged information using prebuilt classifiers to automate identification of law firms and legal concepts, including customizable rules to accelerate privilege review and privilege log creation.
